Source: Adapted from Lambert, WC, Everett MA: The nosology of parapsoriasis. *J Am Acad Dermatol* 1981; 5:373–395.

[a] Some authorities consider large-plaque and small-plaque parapsoriasis as a single entity, usually termed *parapsoriasis en plaques*.

[b] The term *Brocq's disease* is sometimes utilized to denote small- and large-plaque parapsoriasis together as a single entity; less commonly it is used to denote one or more of the other parapsoriases.

[c] Preferred synonyms, based on frequent usage.

[d] "Parapsoriasis en plaques" is pronounced with the final "s" silent, misleading some English-speaking authors to misspell it "parapsoriasis en plaque."

[e] These terms are frequently used by different authors to denote completely different diseases. For this reason, their use is not recommended.

[f] Poikiloderma vasculare atrophicans is sometimes labeled poikiloderma atrophicans vasculare. Either term is acceptable.

[g] When equivalent terms in different languages are in common use, only the Latin name is given: e.g., parapsoriasis guttata (guttate parapsoriasis, parapsoriasis en gouttes, or en gotas); parapsoriasis lichenoides (lichenoid parapsoriasis, parapsoriasis lichenoides); parapsoriasis variegata (variegate parapsoriasis).

[h] Some authorities regard retiform parapsoriasis as a separate entity.

[i] Some authors regard digitate dermatosis, of which fingerprint parapsoriasis is a synonym and xanthoerythrodermia perstans a variant, as a separate entity.

[j] Xanthoerythrodermia perstans is a variant of digitate dermatosis in which the lesions are yellow in color and on clinical examination. It sometimes incorrectly applied to other forms of parapsoriasis with yellow lesions.

[k] Xanthoerythrodermia perstans is an unnecessary term that should be avoided.

[l] Some authors consider acute and chronic pityriasis lichenoides as separate entities.

¶Not true SCID

Table 60.16 Types of severe combined immunodeficiency (SCID). "Leaky SCID" refers to less severe deficits in T-cell number and function due to hypomorphic (milder) mutations in SCID-associated genes. Cartilage–hair hypoplasia (see text) also occasionally presents as SCID with an Omenn-like phenotype. Two most common forms of SCID, accounting for approximately two-thirds of cases, are shaded. B2M, β2-microglobulin; *DCLRE1C*, DNA cross-link repair protein 1C; ER, endoplasmic reticulum; HSM, hepatosplenomegaly; LAN, lymphadenopathy; MHC, major histocompatibility complex; V(D)J, variable/diversity/joining.

defective function of both cell-mediated and humoral immunity [1–3]. The combined frequency of all forms of SCID is 1 in 30,000 to 1 in 100,000 live births, and approximately 75% of patients are male. Almost half of affected individuals have an X-linked recessive form of SCID, which is usually caused by defects in the gene encoding the common γ (γ_c) chain of the IL-12 receptor. Other forms of SCID have autosomal recessive inheritance and include adenosine deaminase (ADA) deficiency (20% of SCID) and JAK3 deficiency (approximately 5% of SCID).

Pathogenesis. The molecular defects that can lead to a SCID phenotype are summarized in Table 177.8 [1,2].

Clinical features. Patients with SCID typically begin to have recurrent infections, chronic diarrhoea and failure to thrive during the first few months of life. Early infections often include mucocutaneous candidiasis, persistent viral gastroenteritis and pneumonias resulting from bacteria, viruses or *P. jiroveci*. Skin infections are commonly caused by *S. aureus* and *Strep. pyogenes* as well as *Candida* spp. Despite their frequent infections, patients with SCID usually lack tonsillar buds and palpable lymphoid tissue.

Infants with SCID may present with morbilliform or seborrhoeic dermatitis-like eruptions [4,5], which often reflect maternofetal GVHD (see Chapter 178). Cutaneous GVHD in patients with SCID may also resemble lichen planus, acrodermatitis enteropathica, Langerhans' cell histiocytosis, ichthyosiform erythroderma or scleroderma. Skin biopsy specimens show the histopathological characteristics of GVHD. Extensive eczematous dermatitis or severe exfoliative erythroderma, often associated with alopecia, may occur without GVHD in infants with Omenn syndrome. Additional features of Omenn syndrome include lymphadenopathy, hepatosplenomegaly and peripheral eosinophilia.

Most patients with SCID have a profound deficiency of T cells and a low absolute lymphocyte count. Patients are further classified by the results of fluorescent-activated cell sorter analysis into those with and without B and NK cells. Diagnosis of a particular form of SCID can be established by genetic testing, flow cytometric analysis of peripheral blood mononuclear cells with antibodies directed against a particular protein (e.g. γ_c or JAK3) that is missing from the cell surface, or measurement of red blood cell levels of a defective enzyme (e.g. ADA) or purine metabolites. In families with a previously affected sibling, prenatal diagnosis of SCID has been performed by fetal DNA analysis and ADA assays.

Maternal T-cell engraftment is detectable (requiring maternal cells to comprise ≥1% of peripheral blood leucocytes) in approximately 50% of infants with SCID [5]. In the majority of cases, the presence of these maternal T cells is asymptomatic; in 30–40% of patients, mild findings such as morbilliform eruptions, cutaneous erythema
